

YouTube Transcript Extraction API Error

Author: Unknown

Date: Unknown

Source: Unknown

This report details an error encountered during the process of extracting a YouTube transcript. The specific message, "Error extracting YouTube transcript: type object 'YouTubeTranscriptApi' has no attribute 'get_transcript'", indicates an `AttributeError` within a programming context, most likely Python. This means that the `YouTubeTranscriptApi` object, presumably part of a library designed for interacting with YouTube's transcript services (such as the `youtube_transcript_api` library), was called to execute a method named `get_transcript`, but the object itself does not possess this particular method. This type of error typically arises from several common issues: incorrect usage of the library (e.g., attempting to call a method that doesn't exist or has been renamed), an outdated version of the library where the method signature or availability has changed, or a simple typographical error in the code attempting to invoke `get_transcript`. To resolve this, it would be necessary to consult the library's official documentation, ensure the correct and most recent version of the library is installed, and carefully review the code that is making the call for any discrepancies.
