YouTube Transcript API Attribute Error

The provided text indicates a specific programming error encountered while attempting to extract a YouTube transcript. The error message, "Error extracting YouTube transcript: type object 'YouTubeTranscriptApi' has no attribute 'list_transcripts'", signifies a failure within a software component, likely a Python script, that is interacting with the `youtube_transcript_api` library. This error means that the `YouTubeTranscriptApi` object, as it is instantiated or referenced in the code, does not contain a method or attribute named `list_transcripts`. This typically suggests several potential underlying issues: the library version being used might be outdated and the method has been deprecated, renamed, or removed in newer versions; there could be a typographical error in the method call within the developer's code; or the `youtube_transcript_api` library itself might not be correctly installed or imported, leading to an incomplete or incorrect object being referenced. Rectification usually involves consulting the library's official documentation, verifying the installed version, and reviewing the code for accurate method calls and imports.
